# Ebrar Dushullovci

## Senior Full-Stack Software Engineer

### SUMMARY

Senior full-stack software engineer with 7+ years of professional experience building real-time operational products, QA automation platforms, business software, and AI-assisted developer tooling. Strongest in React, Next.js, TypeScript, Node.js, and C#/.NET on SQL Server and PostgreSQL. Returned to hands-on engineering after leading customer experience and QA, and now ships end to end: from understanding the workflow to verified, documented delivery. Remote from Prishtina, Kosovo (CET), C2 English, available immediately.

### SKILLS

| | |
|---|---|
| **Frontend** | React, Next.js, TypeScript, Tailwind CSS, shadcn/ui, React Native, Expo, Electron, WPF, WinForms |
| **Backend** | Node.js, Express, C#, .NET Core, ASP.NET Core MVC, Entity Framework, REST APIs, WebSockets, SignalR, OAuth and JWT, Stripe |
| **Data and messaging** | SQL Server, PostgreSQL, MySQL, MongoDB, SQLite, Convex, Redis, RabbitMQ |
| **Quality** | Playwright, Cypress, Selenium, Vitest, xUnit, NUnit, API testing |
| **Platform** | Docker, NGINX, Linux, AWS (EC2, RDS, S3, Lambda), Azure (App Service), Terraform, GitHub Actions |
| **AI tooling** | Agents and MCP, vLLM, LiteLLM, Open WebUI, Prompt and eval design, Claude Code, Codex, OpenCode, Pi, Cursor, GitHub Copilot |
| **Also** | C++ (libobs), FFmpeg, Python, pnpm and Turborepo, Zod, OpenAPI, Figma Code Connect, ADRs |

### EXPERIENCE

**Senior Full-Stack Software Engineer** · AutomatedPros — Jul 2023 – Present

Full-time · Remote

Primary engineer on Orderific, a restaurant operations platform used daily by dozens of restaurants, then lead on the QA automation platform and the team's AI tooling. I own features from API design to the screens staff use during service.

- **Kitchen tickets in under a second, 150+ orders an hour at peak.** Replaced kitchen screens that polled the server every few seconds with a persistent WebSocket channel per venue, and moved order writes off the request path into a queue so a burst of orders never blocks the next one. Removed the manual order calls between floor and kitchen.
- **About 40% less effort per delivery or payment integration, with three delivery partners onboarded on it.** Partners used to be wired directly into the order flow, so each one meant touching core code. Rebuilt this as one internal order contract with a small adapter per partner, so a new integration is one adapter plus its tests.
- **Kitchen tablet task completion from 83% to 98% in staff usability tests.** The old screen was a desktop layout squeezed onto a 10-inch tablet. Rebuilt it with shadcn components: large touch targets, one ticket per card, colour-coded status, and the most common action always one tap away. Measured before and after with the same tasks.
- **Led the QA management platform end to end; regression runs went from days to hours.** QA used to run API checks by hand, one case at a time. Now they write cases in templates, the platform turns them into executable API calls, runs suites on demand or in batches with live results, and files a ticket in the project-management tool for every failure. Several hundred templates are in use.
- **Roughly halved delivery time on design-heavy pages with the Figma-to-Next.js generator.** Component trees are generated straight from the Figma structure instead of hand-built from screenshots, and a visual-diff loop catches drift before review, so engineers spend their time on behaviour rather than layout.
- **Self-hosted AI infrastructure for the team, with model spend well over half lower than hosted APIs.** Open-weight models served on the team's own GPU servers through vLLM, LiteLLM routing each request to the cheapest model that handles it and escalating to a hosted API only when needed, Open WebUI and an OpenAI-compatible gateway behind NGINX. Wrote the guidelines for using agents and tool-calling without leaking data or budget.

- **Review most frontend pull requests and set the team's component and testing conventions.**

### **.NET Consultant** · Infotech L.L.C

Jan 2022 – Present

Part-time · Remote

Retained by my former employer, alongside my primary role, for architecture reviews, performance work, incident response, and mentoring on the .NET business systems I originally helped build.

- **Query response times down by up to 60% in critical workflows; the end-of-day reporting job went from minutes to seconds.** Profiled the slowest workflows with SQL Server execution plans, added the missing indexes, replaced row-by-row loops and N+1 patterns with set-based queries, and moved the heaviest reports to precomputed tables refreshed on a schedule.
- **AWS hosting costs down 15%.** Audits found oversized instances running around the clock plus unused storage and snapshots. Right-sized the instances, scheduled non-production environments to shut down out of hours, and cleaned up the leftovers.
- **Onboarding for six junior developers from four weeks to ten days.** Replaced learn-by-asking with written playbooks for the codebase, environments, and release process, plus scheduled pairing in the first two weeks so new developers ship a real change in week one.
- **Business-critical services restored within two hours of an incident, 99.9% uptime.** Runbooks for the recurring failure types and a rollback path for every deployment, so most incidents are a known fix rather than a fresh investigation.
- **Planned the upgrade path from .NET Framework to modern .NET for the core suite.**

### **Chief Experience Officer** · AutomatedPros

Nov 2021 – Jul 2023

Leadership

Ran customer experience and the QA team, sitting between support, QA, product, and engineering. Returned to hands-on engineering by choice once the function ran without me.

- **Grew the QA team from two to five and chose its testing tools, automation frameworks, and bug-tracking setup.**
- **Escaped defects reaching customers down around 40%.** Introduced a release-readiness checklist, automated the regression suite for the highest-traffic flows, and made QA sign-off a gate before release rather than a step after it.
- **Customer satisfaction lifted into the 90s.** Support tooling integrated with the management system put the customer's setup and order history on the agent's screen, cutting the back-and-forth per ticket, and recurring complaints were routed into the product backlog so the same issue stopped coming back.
- **Turned support and QA findings into a prioritised product backlog the development team worked from.**

### **.NET Developer** · Infotech L.L.C

Aug 2019 – Jan 2022

Full-time · Hybrid

Developed and maintained a .NET desktop business-management suite used by over a hundred businesses: shops, restaurants, repair garages, and fuel stations. Inventory, sales, tax documents, POS, restaurant orders, and hardware control.

- **Car-repair parts screen from 15 seconds to 2 seconds (87%).** It loaded the full catalogue and filtered on the client. Rewrote it to query only matching parts with proper indexes, paginate results, and cache the reference lists, so the first results show almost instantly.
- **Invoicing, reporting, and tax documents automated on one data model.** Invoices and tax documents were assembled by hand from sales records. Generating them from the same data as live sales and inventory removed the re-typing and the mismatches between sales, stock, and finance.
- **Remote fuel-pump activation and deactivation with safety protocols, live at multiple stations, plus restaurant order tracking with kitchen workflows and billing.**
- **Project lead on a .NET MVC logistics and delivery web application.** Registration, order placement, real-time tracking, and a database tuned for high order volumes.

### **.NET Developer** · CREA-KO

Jan 2019 – Jul 2019

Full-time

First developer role, on the team migrating a web-based ERP used across the company's client base from .NET Framework to .NET Core MVC, refactoring both front end and back end.

- **Cleared 100+ security warnings from CI builds.** Replaced the 12 deprecated NuGet packages first so the rest of the migration built cleanly.
- **Migration blockers cleared two weeks ahead of cut-over.** Split the remaining compatibility fixes across the four developers by module so nobody blocked anyone else.

Earlier: Project Manager and Digital Marketing Manager at Beautyque (2017–2018); Technical Support Agent at Bit by Bit (2017).

## SELECTED PERSONAL PROJECTS

### **ClipVault** · Shipped · v1.8.0

getclipvault.netlify.app

A free, open-source game-clipping app for Windows. A rolling buffer keeps the last two minutes of play; press the hotkey and they are saved as an MP4 with separate game and microphone tracks, ready to trim and export small enough to post. C++ capture backend on libobs with NVENC hardware encoding and x264 fallback.

C++ · libobs · Electron · React · FFmpeg

### **ShowTracker** · Live on the web

showtrackerapp.netlify.app

A TV, anime, and movie tracker built as a faster, cleaner alternative to TV Time: one queue that remembers where you left off and tells you what airs next, from one Expo codebase for web, iOS, and Android. Discovery, episode tracking, watchlists, schedule projections, custom lists, imports, and statistics.

Expo · React Native · TypeScript · Convex · NativeWind

### **Nestor** · In development

trynestor.netlify.app

A local-first desktop app for job search. Job Finder searches the sites you choose in its own browser, shows how well each job fits and why, tailors a resume per job, and fills in applications in the mode you pick. Live Assistant helps during the interview itself. Thirteen-package TypeScript monorepo with typed IPC boundaries and 40 architecture decision records.

Electron · React · TypeScript · SQLite · Playwright

## EDUCATION

| | |
|---|---|
| **Degree** | BSc Computer Science, Riinvest College, Prishtina |

## LANGUAGES & AVAILABILITY

| | |
|---|---|
| **Languages** | English (C2, proficient), Albanian (native) |
| **Availability** | Available now, no notice period. Remote, or hybrid within Europe. |
